

*Tooling solutions for the power utility industry.*

## DOUBLE-ACTING TOOLS ARE BUILT TO PROVIDE SAFETY, QUALITY AND RELIABILITY IN EVERY STEP OF HIGH PRESSURE TOOL OPERATION.

In most cases, double-acting tools are lighter and more compact than comparable crimping and cutting equipment, insuring easier and safer use. This is especially important in compact working areas and hot stick use when every ounce of a tool's weight is felt by the operator.

The one-hand valve operation is safer and easier to use, leaving your other hand free to control the tool head. Each valve has two pressure reliefs for extra safety: One to reduce the return cycle pressure to prevent damage to the tool; The second to protect against over pressurizing.

Each Reliable crimping head has a built-in pressure reducing cavity to reduce the risk of personal injury from a high-pressure oil leak.

The REL-10-1 Intensifier features a built-in pressure relief to control system pressure build-up. Specifically, an unloading valve dumps the working pressure at 4,000 to 10,000 psi. An additional safety relief provides protection in case the unloading valve should fail.

### DOUBLE-ACTING HYDRAULIC SYSTEM

**Superior Performance** - beats competitive power tool systems on key features and benefits.

**Better tool control** - start, stop, feather, and position your crimping or cutting head with ease.

**No die hang-ups** - crisply retracts the die after every crimp.

**Compatible with many existing tools** or convert your existing tools and dies to our double-acting system.

**Consistent Pressure** - Delivers up to 10,000 psi at tool head, regardless of positioning.

**Quality Features** - Lightweight, built-in pressure reliefs; ground dumps; scavenger pump reduces back-pressure problems; one-hand valve operation; and certified non-conductive hoses.

**Portability** - Lighter and more streamlined than most other tools.

**Adaptability** - Use Reliable tools with your truck's existing system or one of our portable power units.

### VALVES

Reliable valves feature one-hand operation for extreme ease of use. They can be direct-coupled to the tool or, if you wish, attached with hoses for remote operation. In addition, they feature a built-in relief valve to limit tool return pressure and a ground dump safety valve to prevent over pressurizing in case the return hose becomes disconnected or plugged.

### CRIMPING HEADS

In many cases, double-acting crimping heads are significantly lighter than competitive models. Safety is designed-in as well. One example: A pressure reducing cavity is designed into each head to reduce the risk of personal injury from a high-pressure oil leak.

### CUTTERS

All cutters are double-acting and available in capacities from 1/2 in. to 4 in. Some models can handle a wide range of materials, including rebar, ACSR, guy strand, and bolts. Other safety features include hoses rated at four times the working pressure, and dielectrically safe hoses.
